# 1 Introduction

# 2 Algorithm

# 3 Experimentations

# 4 Conclusion

# Introductory example

## Application : Lung cancer

Categories :

$C_3$  : No cancer

$C_2$  : Curable cancer

$C_1$  : Incurable cancer

$C_3 \succ C_2 \succ C_1$

- ▶ 9394 patients analyzed
- ▶ Monotone attributes (number of cigarettes per day, age, ...)
- ▶ Output variable : no cancer, cancer, incurable cancer
- ▶ Predict the risk to get a lung cancer for other patients on basis of their attributes

# MR-Sort procedure

## Main characteristics

- ▶ Sorting procedure
- ▶ Simplified version of the ELECTRE TRI procedure [Yu, 1992]
- ▶ Axioms based [Slowinski et al., 2002, Bouyssou and Marchant, 2007a, Bouyssou and Marchant, 2007b]

## Parameters

- ▶ Profiles' performances ( $b_{h,j}$  for  $h = 1, \dots, p - 1; j = 1, \dots, n$ )
- ▶ Criteria weights ( $w_j$  for  $n = 1, \dots, n$ )
- ▶ Majority threshold ( $\lambda$ )

# MR-Sort procedure

## Main characteristics

- ▶ Sorting procedure
- ▶ Simplified version of the ELECTRE TRI procedure [Yu, 1992]
- ▶ Axioms based [Slowinski et al., 2002, Bouyssou and Marchant, 2007a, Bouyssou and Marchant, 2007b]

## Parameters

### Assignment rule

$$a \in C_h$$

$$\Leftrightarrow$$

$$\sum_{j: a_j \geq b_{h-1,j}} w_j \geq \lambda \text{ and } \sum_{j: a_j \geq b_{h,j}} w_j < \lambda$$

# Inferring the parameters

## What already exists to infer MR-Sort parameters ?

- ▶ Mixed Integer Program learning the parameters of an MR-Sort model [Leroy et al., 2011]
- ▶ Metaheuristic to learn the parameters of an ELECTRE TRI model [Doumpos et al., 2009]
- ▶ Not suitable for large problems : computing time becomes huge when the number of parameters or examples increases

## Our objective

- ▶ Learn a MR-Sort model from a large set of assignment examples
- ▶ Efficient algorithm (i.e. can handle 1000 alternatives, 10 criteria, 5 categories)

# Principe of the metaheuristic

## Input parameters

- ▶ Assignment examples
- ▶ Performances of the examples on the  $n$  criteria

## Objective

- ▶ Learn an MR-Sort model which is compatible with the highest number of assignment examples, i.e. maximize the classification accuracy,

$$CA = \frac{\text{Number of examples correctly restored}}{\text{Total number of examples}}$$

## What we know

- ▶ Easy : Learning only the weights and majority threshold
- ▶ Difficult : Learning only the profiles

# Metaheuristic to learn all the parameters

## Algorithm

Generate a population of  $N_{model}$  models with profiles initialized with a heuristic

**repeat**

**for all** model  $M$  of the set **do**

Learn the weights and majority threshold with a linear program, using the current profiles

Adjust the profiles with a heuristic  $N_{it}$  times, using the current weights and threshold.

**end for**

Reinitialize the  $\left\lfloor \frac{N_{model}}{2} \right\rfloor$  models giving the worst  $CA$

**until** Stopping criterion is met

## Stopping criterion

Stopping criterion is met when one model has a  $CA$  equal to 1 or when the algorithm has run  $N_o$  times.

# Profiles initialization

## Principe

- ▶ By a heuristic
- ▶ On each criterion  $j$ , give to the profile a performance such that  $CA$  would be max for the alternatives belonging to  $h$  and  $h + 1$  if  $w_j = 1$ .
- ▶ Take the probability to belong to a category into account

## Example 1 : Where should the profile be set on criterion $j$ ?

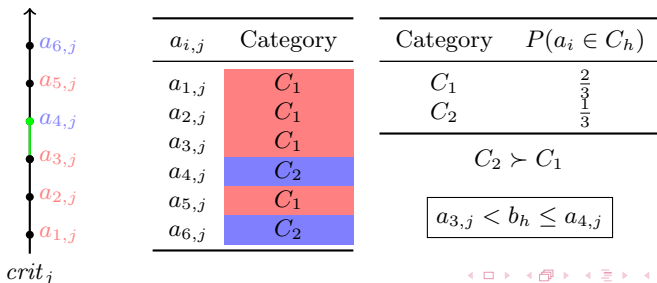

# Profiles initialization

## Principe

- ▶ By a heuristic
- ▶ On each criterion  $j$ , give to the profile a performance such that  $CA$  would be max for the alternatives belonging to  $h$  and  $h + 1$  if  $w_j = 1$ .
- ▶ Take the probability to belong to a category into account

## Example 2 : Where should the profile be set on criterion $j$ ?

# Learning the weights and the majority threshold

## Principe

- ▶ Maximizing the classification accuracy of the model
- ▶ Using a linear program with no binary variables

## Linear program

$$\text{Objective : } \min \sum_{a_i \in A} (x'_i + y'_i) \quad (1)$$

$$\sum_{\forall j | a_i S_j b_{h-1}} w_j - x_i + x'_i = \lambda \quad \forall a_i \in A_h, h = \{2, \dots, p-1\} \quad (2)$$

$$\sum_{\forall j | a_i S_j b_h} w_j + y_i - y'_i = \lambda - \delta \quad \forall a_i \in A_h, h = \{1, \dots, p-2\} \quad (3)$$

$$\sum_{j=1}^n w_j = 1 \quad (4)$$

# Learning the profiles

Case 1 : Alternative  $a_1$  classified in  $C_2$  instead of  $C_1$  ( $C_2 \succ C_1$ )

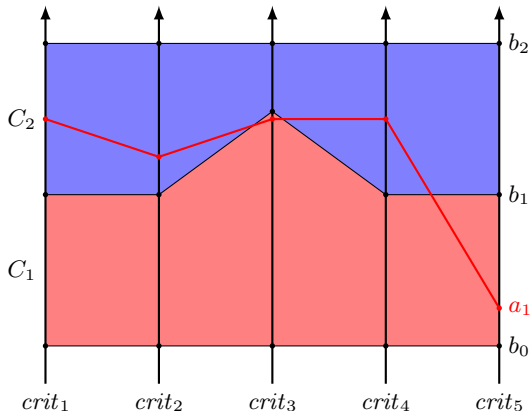

- ▶  $a_1$  is classified by the **DM** into category  $C_1$
- ▶  $a_1$  is classified by the **model** into category  $C_2$
- ▶  $a_1$  outranks  $b_1$
- ▶ Profile too low on one or several criteria (in red)

$$w_j = 0.2 \text{ for } j = 1, \dots, 5; \lambda = 0.8$$

# Learning the profiles

Case 1 : Alternative  $a_1$  classified in  $C_2$  instead of  $C_1$  ( $C_2 \succ C_1$ )

- ▶  $a_1$  is classified by the **DM** into category  $C_1$
- ▶  $a_1$  is classified by the **model** into category  $C_2$
- ▶  $a_1$  outranks  $b_1$
- ▶ Profile too low on one or several criteria (in red)

$$w_j = 0.2 \text{ for } j = 1, \dots, 5; \lambda = 0.8$$

# Learning the profiles

Case 2 : Alternative  $a_2$  classified in  $C_1$  instead of  $C_2$  ( $C_2 \succ C_1$ )

$$w_j = 0.2 \text{ for } j = 1, \dots, 5; \lambda = 0.8$$

- ▶  $a_2$  is classified by the **DM** into category  $C_2$
- ▶  $a_2$  is classified by the **model** into category  $C_1$
- ▶  $a_2$  doesn't outrank  $b_1$
- ▶ Profile too high on one or several criteria (in blue)
- ▶ If profile moved by  $\delta_{b_1,2,4}$  on  $g_4$  and/or by  $\delta_{b_1,2,5}$  on  $g_5$ , the alternative will be rightly classified

# Learning the profiles

Case 2 : Alternative  $a_2$  classified in  $C_1$  instead of  $C_2$  ( $C_2 \succ C_1$ )

$$w_j = 0.2 \text{ for } j = 1, \dots, 5; \lambda = 0.8$$

- ▶  $a_2$  is classified by the **DM** into category  $C_2$
- ▶  $a_2$  is classified by the **model** into category  $C_1$
- ▶  $a_2$  doesn't outrank  $b_1$
- ▶ Profile too high on one or several criteria (in blue)
- ▶ If profile moved by  $\delta_{b_1,2,4}$  on  $g_4$  and/or by  $\delta_{b_1,2,5}$  on  $g_5$ , the alternative will be rightly classified

# Learning the profiles

- ▶  $V_{h,j}^{+\delta}$  (resp.  $V_{h,j}^{-\delta}$ ) : the sets of alternatives misclassified in  $C_{h+1}$  instead of  $C_h$  (resp.  $C_h$  instead of  $C_{h+1}$ ), for which moving the profile  $b_h$  by  $+\delta$  (resp.  $-\delta$ ) on  $j$  results in a correct assignment.

- ▶  $C_2 \succ C_1$
- ▶  $w_j = 0.2$  for  $j = 1, \dots, 5$
- ▶  $\lambda = 0.8$
- ▶  $a_3 \in A_{2 \leftarrow DM}^{1 \leftarrow Model}$

# Learning the profiles

- ▶  $V_{h,j}^{+\delta}$  (resp.  $V_{h,j}^{-\delta}$ ) : the sets of alternatives misclassified in  $C_{h+1}$  instead of  $C_h$  (resp.  $C_h$  instead of  $C_{h+1}$ ), for which moving the profile  $b_h$  by  $+\delta$  (resp.  $-\delta$ ) on  $j$  results in a correct assignment.

- ▶  $C_2 \succ C_1$
- ▶  $w_j = 0.2$  for  $j = 1, \dots, 5$
- ▶  $\lambda = 0.8$
- ▶  $a_3 \in A_{2 \leftarrow DM}^{1 \leftarrow Model}$

# Learning the profiles

- $V_{h,j}^{+\delta}$  (resp.  $V_{h,j}^{-\delta}$ ) : the sets of alternatives misclassified in  $C_{h+1}$  instead of  $C_h$  (resp.  $C_h$  instead of  $C_{h+1}$ ), for which moving the profile  $b_h$  by  $+\delta$  (resp.  $-\delta$ ) on  $j$  results in a correct assignment.

# Learning the profiles

- ▶  $W_{h,j}^{+\delta}$  (resp.  $W_{h,j}^{-\delta}$ ) : the sets of alternatives misclassified in  $C_{h+1}$  instead of  $C_h$  (resp.  $C_h$  instead of  $C_{h+1}$ ), for which moving the profile  $b_h$  of  $+\delta$  (resp.  $-\delta$ ) on  $j$  strengthens the criteria coalition in favor of the correct classification but will not by itself result in a correct assignment.

- ▶  $C_2 \succ C_1$
- ▶  $w_j = 0.2$  for  $j = 1, \dots, 5$
- ▶  $\lambda = 0.8$
- ▶  $a_4 \in A_{2 \leftarrow DM}^{1 \leftarrow Model}$

# Learning the profiles

- $W_{h,j}^{+\delta}$  (resp.  $W_{h,j}^{-\delta}$ ) : the sets of alternatives misclassified in  $C_{h+1}$  instead of  $C_h$  (resp.  $C_h$  instead of  $C_{h+1}$ ), for which moving the profile  $b_h$  of  $+\delta$  (resp.  $-\delta$ ) on  $j$  strengthens the criteria coalition in favor of the correct classification but will not by itself result in a correct assignment.

# Learning the profiles

- ▶  $Q_{h,j}^{+\delta}$  (resp.  $Q_{h,j}^{-\delta}$ ) : the sets of alternatives correctly classified in  $C_{h+1}$  (resp.  $C_h$ ) for which moving the profile  $b_h$  of  $+\delta$  (resp.  $-\delta$ ) on  $j$  results in a misclassification.

- ▶  $C_2 \succ C_1$
- ▶  $w_j = 0.2$  for  $j = 1, \dots, 5$
- ▶  $\lambda = 0.8$
- ▶  $a_5 \in A_{2 \leftarrow DM}^{2 \leftarrow Model}$

# Learning the profiles

- ▶  $Q_{h,j}^{+\delta}$  (resp.  $Q_{h,j}^{-\delta}$ ) : the sets of alternatives correctly classified in  $C_{h+1}$  (resp.  $C_h$ ) for which moving the profile  $b_h$  of  $+\delta$  (resp.  $-\delta$ ) on  $j$  results in a misclassification.

# Learning the profiles

- ▶  $R_{h,j}^{+\delta}$  (resp.  $R_{h,j}^{-\delta}$ ) : the sets of alternatives misclassified in  $C_{h+1}$  instead of  $C_h$  (resp.  $C_h$  instead of  $C_{h+1}$ ), for which moving the profile  $b_h$  of  $+\delta$  (resp.  $-\delta$ ) on  $j$  weakens the criteria coalition in favor of the correct classification but does not induce misclassification by itself.

- ▶  $C_2 \succ C_1$
- ▶  $w_j = 0.2$  for  $j = 1, \dots, 5$
- ▶  $\lambda = 0.8$
- ▶  $a_6 \in A_{2 \leftarrow DM}^{1 \leftarrow Model}$

# Learning the profiles

- $R_{h,j}^{+\delta}$  (resp.  $R_{h,j}^{-\delta}$ ) : the sets of alternatives misclassified in  $C_{h+1}$  instead of  $C_h$  (resp.  $C_h$  instead of  $C_{h+1}$ ), for which moving the profile  $b_h$  of  $+\delta$  (resp.  $-\delta$ ) on  $j$  weakens the criteria coalition in favor of the correct classification but does not induce misclassification by itself.

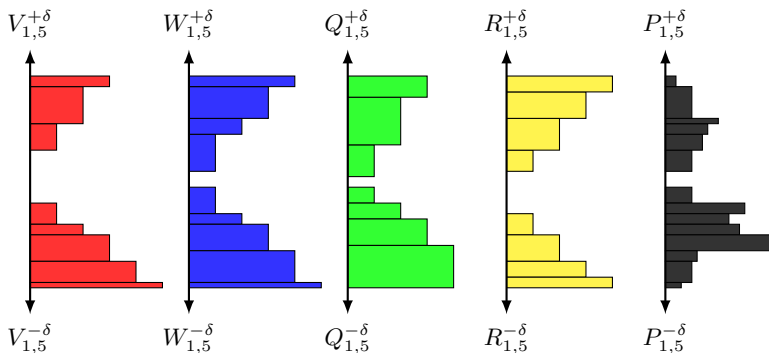

# Learning the profiles

$$P(b_{1,j}^{+\delta}) = \frac{k_V |V_{1,j}^{+\delta}| + k_W |W_{1,j}^{+\delta}| + k_T |T_{1,j}^{+\delta}|}{d_V |V_{1,j}^{+\delta}| + d_W |W_{1,j}^{+\delta}| + d_T |T_{1,j}^{+\delta}| + d_Q |Q_{1,j}^{+\delta}| + d_R |R_{1,j}^{+\delta}|}$$

with :  $k_V = 2, k_W = 1, k_T = 0.1, d_V = d_W = d_T = 1, d_Q = 5, d_R = 1$

# Learning the profiles

## Overview of the complete algorithm

for all profile  $b_h$  do

  for all criterion  $j$  chosen randomly do

    Choose, in a randomized manner, a set of positions in the interval  $[b_{h-1,j}, b_{h+1,j}]$

    Select the one such that  $P(b_{h,j}^\Delta)$  is maximal

    Draw uniformly a random number  $r$  from the interval  $[0, 1]$ .

    if  $r \leq P(b_{h,j}^\Delta)$  then

      Move  $b_{h,j}$  to the position corresponding to  $b_{h,j} + \Delta$

      Update the alternatives assignment

    end if

  end for

end for

# Experimentations

1. What's the efficiency of the algorithm ?
2. How much alternatives are required to learn a good model ?
3. What's the capability of the algorithm to restore assignments when there are errors in the examples ?
4. Is the model able to represent assignments obtained with an additive value function sorting model ?

## Tests with artificial datasets
